T-018700

Researchers developed these knock-in mice by using homologous recombination to clone the R120G mutation into exon 3 of the α B-crystallin gene (*cryab*). α B-crystallin (*cryAB*) helps to maintain protein stability in the eye lens, which is necessary for transparency. The R120G mutation causes aggregation that results in early-onset cataracts, and the *cryAB* R120G mutant knock-in mice consequently can be used as a model for studying therapies for treating and reversing cataracts.
