

IGG MONOCLONAL ANTIBODIES TO ENTEROCOCCUS FAECALIS GELATINASE

Shaikh, Nurmohammad, Tarr, Phillip

Gill, John

T-011748

Monoclonal antibodies against *E. faecalis* gelatinase developed as a treatment for Crohn's disease. *E. faecalis* secretes many proteins into the gastrointestinal environment - such as Gelatinase (GelE). GelE degrades several proteins including gelatin, collagen, hemoglobin, and bioactive peptides. Two murine monoclonal antibodies (mAb 6H3 and mAb 8A3) neutralize GelE in a dose-dependent manner and are able to block inflammation in a cell culture system.
