

UPAB1 PLASMID LACKING PAB5

<u>Di Venanzio, Gisela, Feldman, Mario</u> <u>Hardin, Clyde "Frank"</u>

T-019205

An UPAB1 derivative, UPAB1p-, that spontaneously loss pAB5 was identified by detection of restored Hcp secretion and isolated via an ELISA.

Compared to wildype UPAB1, UPAB1p- displayed comparable growth in vitro in both rich medium and urine from healthy donors, indicating that less pAB5 did not influence bacterial growth. However, UPAB1p- displayed increased susceptibility to multiple antibiotics.

Publication: <u>Urinary tract colonization is enhanced by a plasmid that regulates uropathogenic Acinetobacter baumannii chromosomal genes</u>
